Notes / Comments
Based on the data and audio captured in this measurement location, the events on the 20th and 22nd were audible at the measurement position - live music and amplified music was clear. It should be noted that during the events periods, this position is dominated by noise associated to patrons leaving and entering the venue. *It should be noted that on the 21st elevated noise levels were observed at position N2, whereby background music and patrons conversing was dominant, however this was not reflected at the N1 monitoring position (due to shielding from the surrounding buildings).

Notes / Comments
Based on the data and audio captured in this measurement location, the Newbury PH hosted 2 events this week. The captured data indicates that the events were clearly audible above background noise activity and are considered the dominant noise source. Details of the events are presented in the table below. *It should be noted that on the 21st elevated noise levels were observed, however this was not strictly associated to an event - the dominant noise source during this period was background music as well as patrons conversing, this is reflected in the overall LAeq captured during this period (it being lower than events on Thursday and Saturday).
